

# Development of a flight-simulator coupling ASDEX Upgrade control system to ASTRA

IPP

Marco Biasizzo

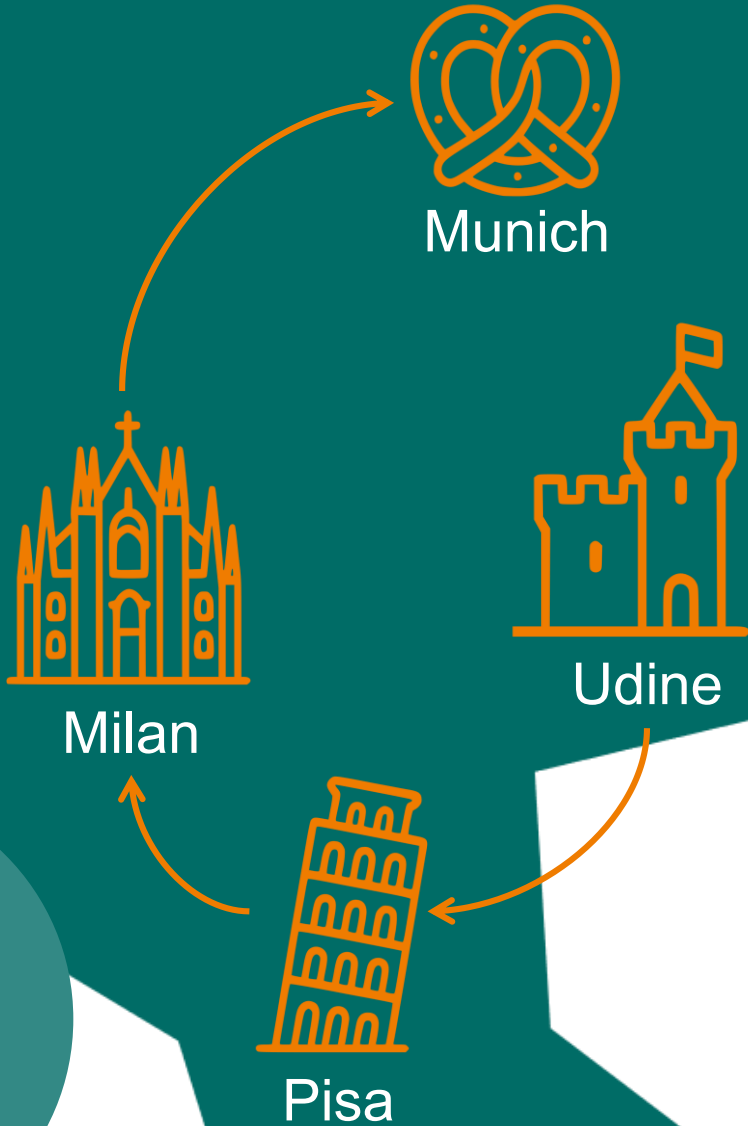

➤ *HEPP Introductory Talk, 7<sup>th</sup> July 2025*

Supervisors: Pierre David, Mariano Ruiz

This work has been carried out within the framework of the EUROfusion Consortium, funded by the European Union via the Euratom Research and Training Programme (Grant Agreement No 101052200 — EUROfusion). Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union or the European Commission. Neither the European Union nor the European Commission can be held responsible for them.

# Something about me

# Marco @ IPP

- **CODAC Control** team  
(**C**ontrol and **D**ata **AC**quisition)

- PhD student at **UPM**  
(Universidad Politécnica de Madrid)
- In **Information Engineering**

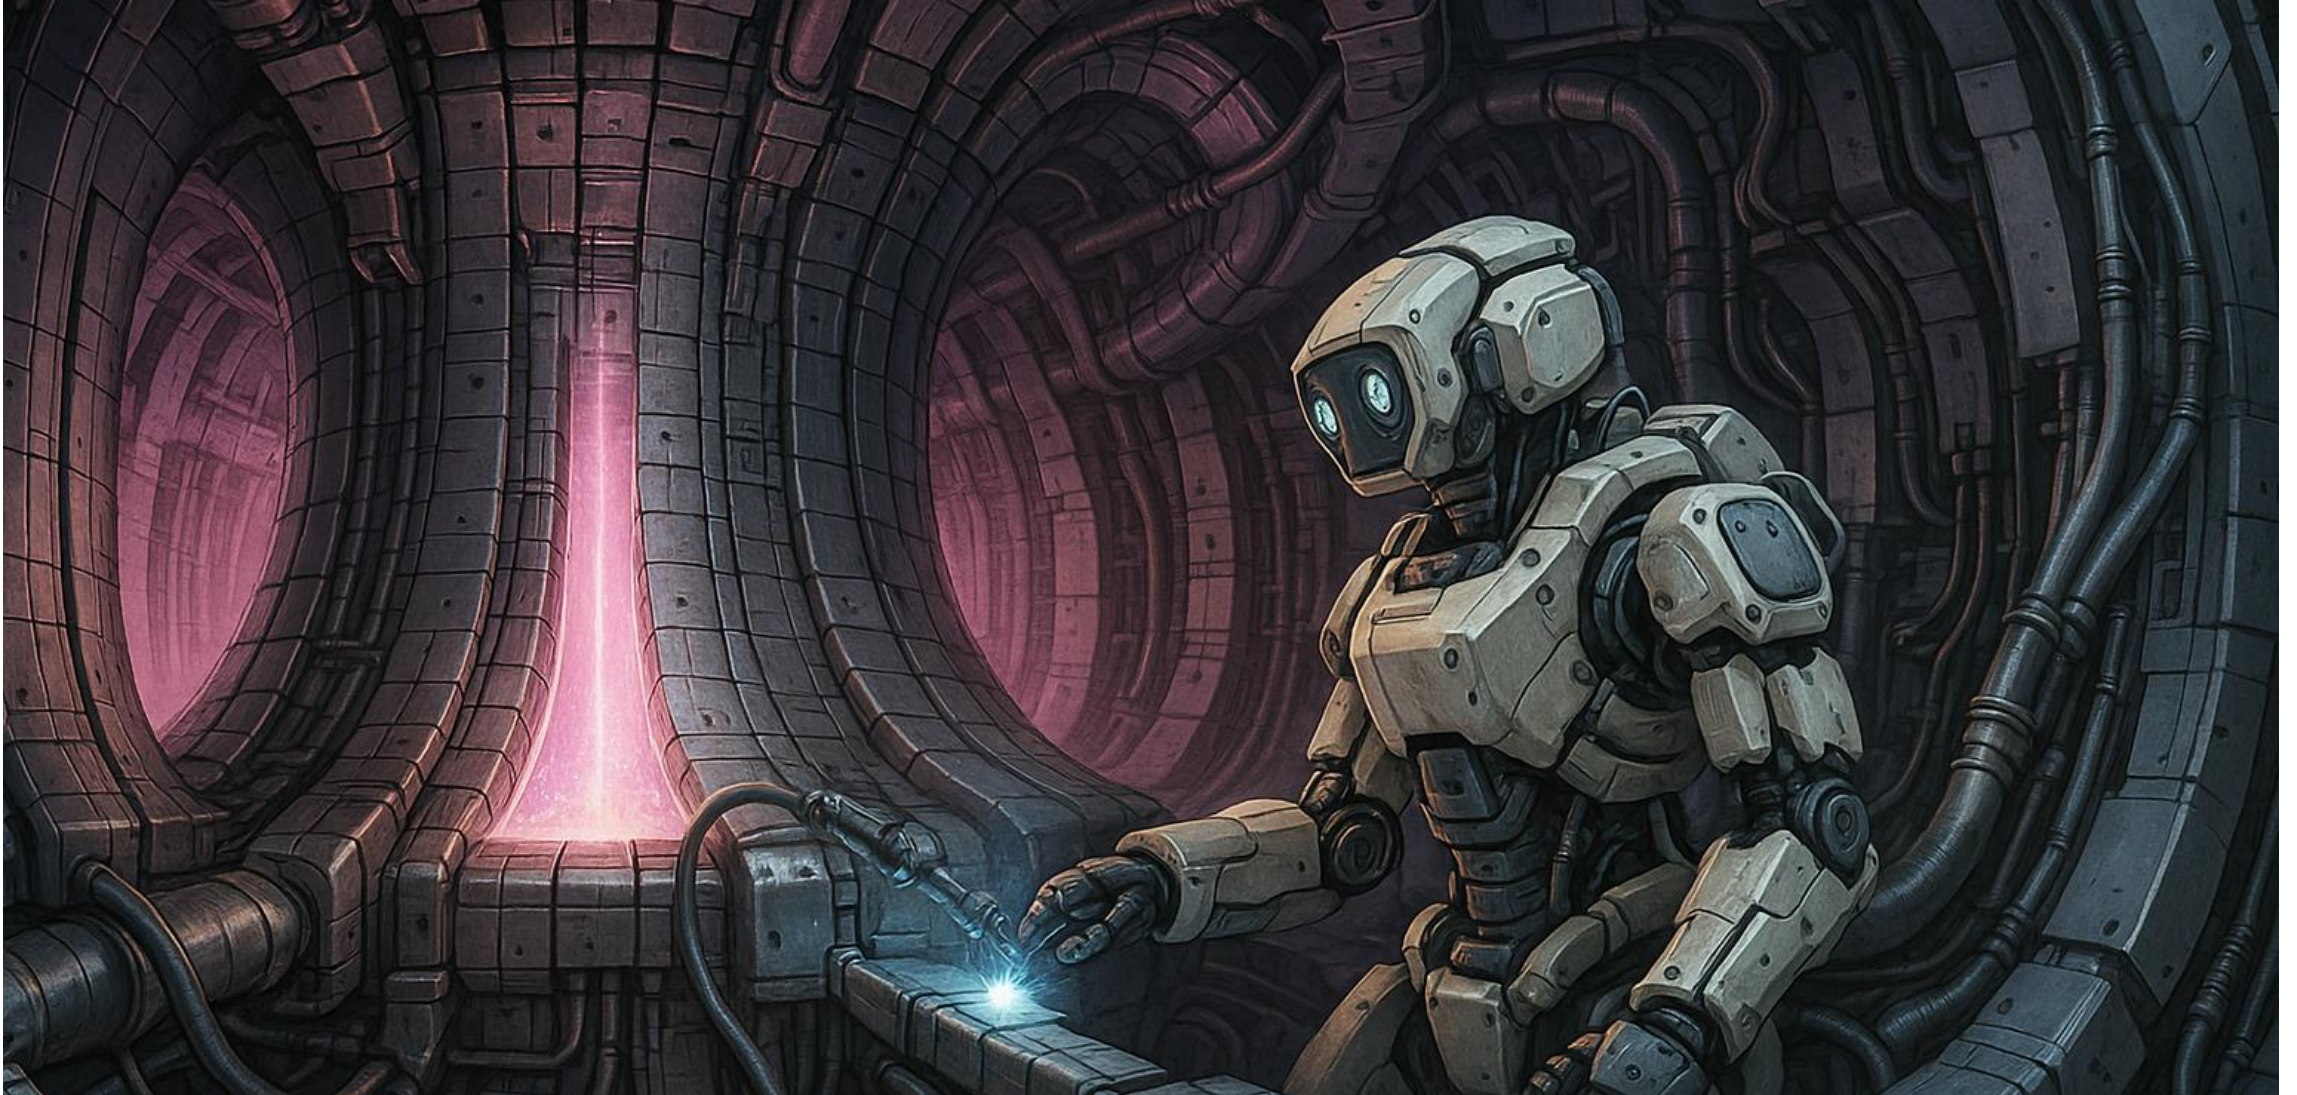

**POLITÉCNICA**

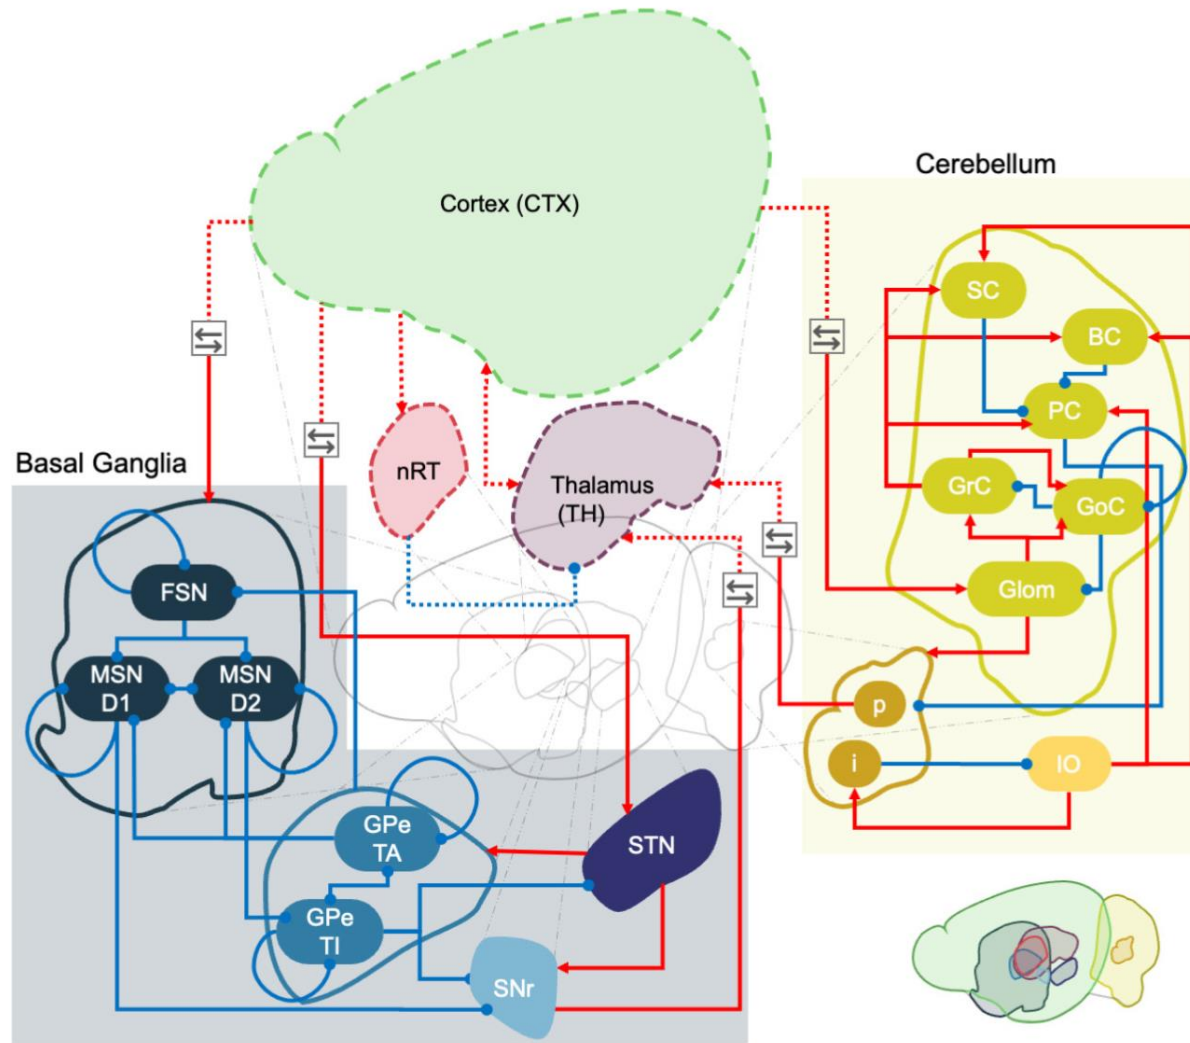

# Outline

- 1) Something about me
- 2) Master thesis project
- 3) Control: what and why?
- 4) AUG flight simulator

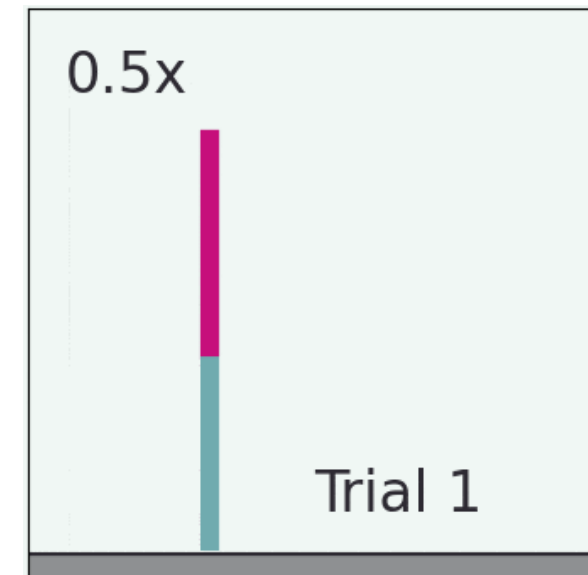

# Cerebellum as motion controller

- **Integrated model** of mouse motor brain regions
- Applied to **control** a simple movement
- Based on a **reinforcement learning** approach, the cerebellum activity self-adapted to perform the task

Gambosi, Benedetta, et al. "A model with dopamine depletion in basal ganglia and cerebellum predicts changes in thalamocortical beta oscillations." *International Journal of Neural Systems* 34.09 (2024): 2450045.

# Outline

- 1) Something about me
- 2) Master thesis project
- 3) **Control**: what and why?
- 4) AUG flight simulator

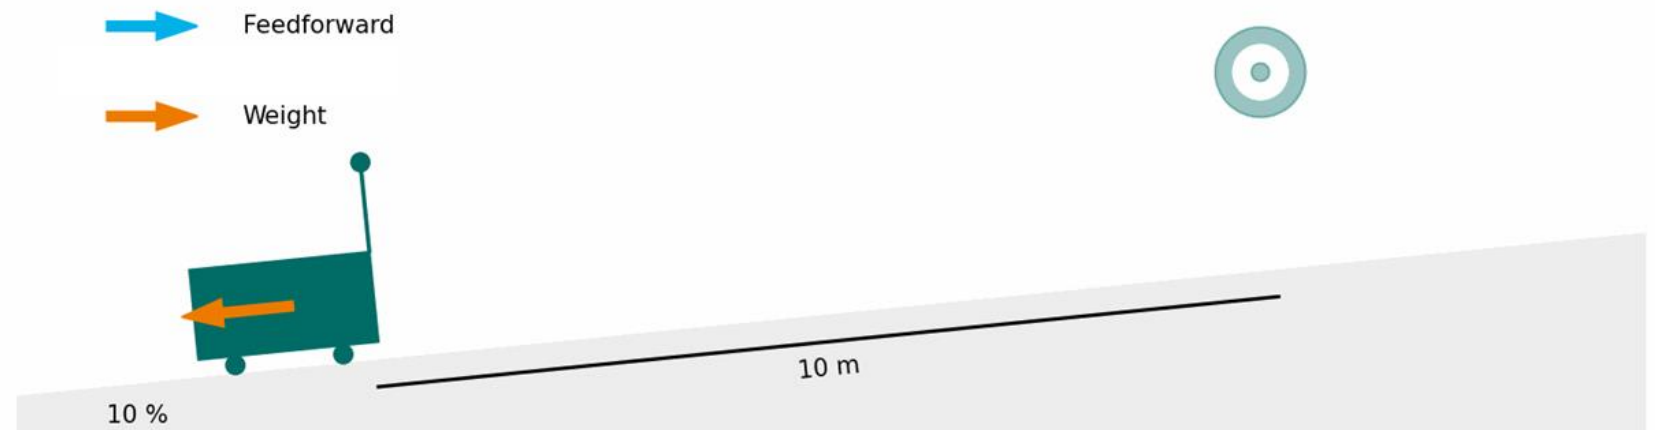

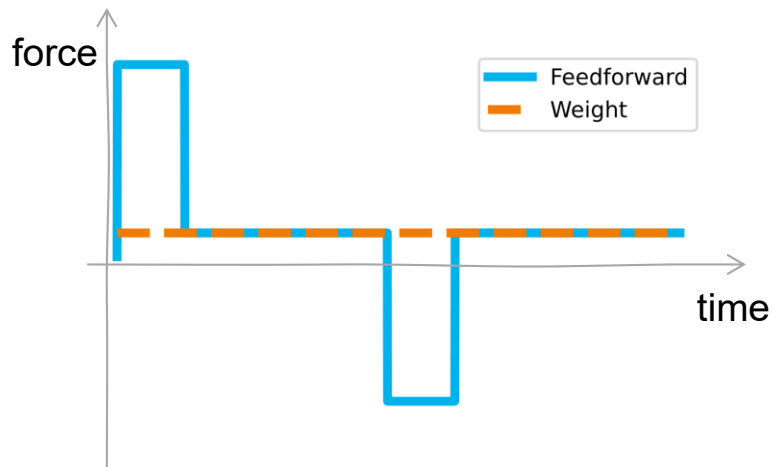

# A control example: cart on an inclined plane

## Hypotheses:

- Angle of incline: 10 %
- Distance from the goal  $d = 10$  m

Find the force **feedforward force** to reach the target

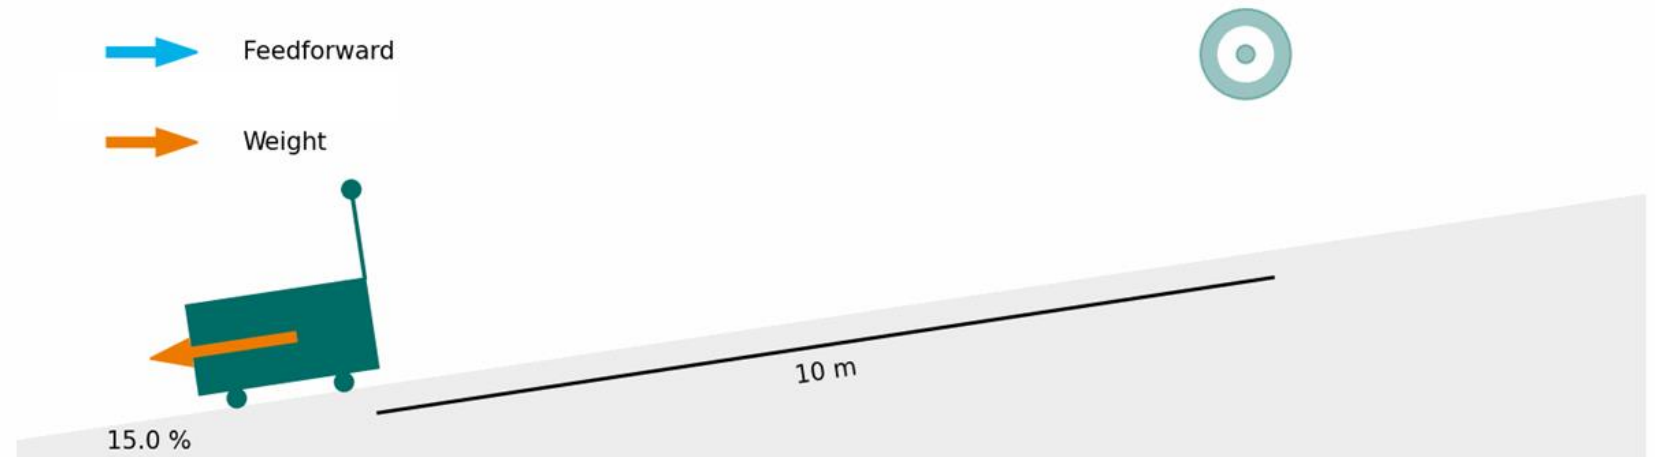

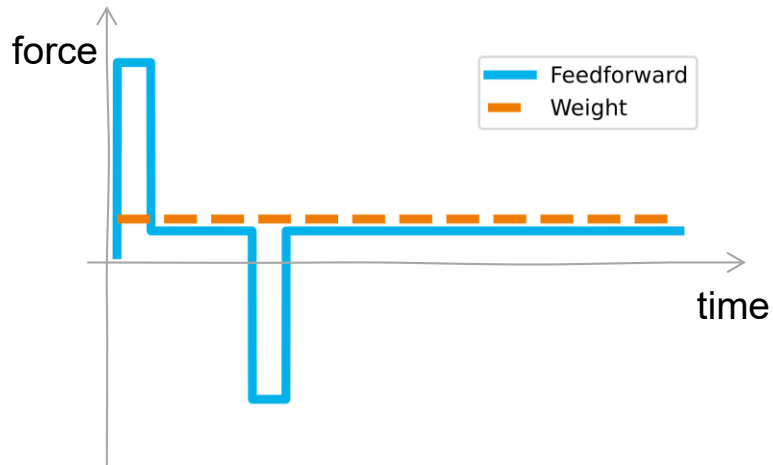

# Changing conditions: increased angle of incline

## Hypotheses:

- Angle of incline: ~~10 %~~ 15 %, but not known

Cart is lost

# Feedback control : PID controller

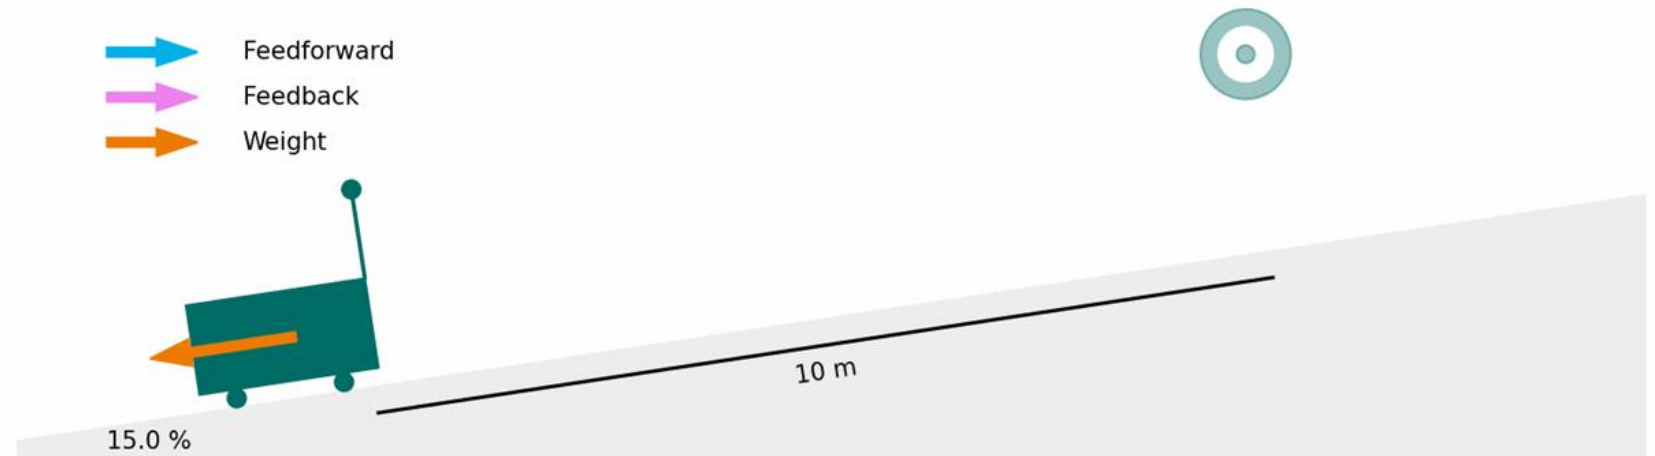

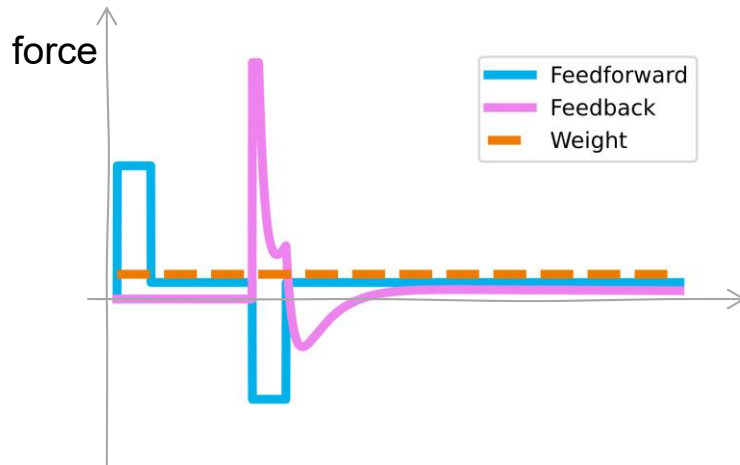

## Hypotheses:

- Angle of incline: ~~10 %~~ 15 %, but not known
- Distance from the target is known

Apply a **feedback** force dependent on the distance

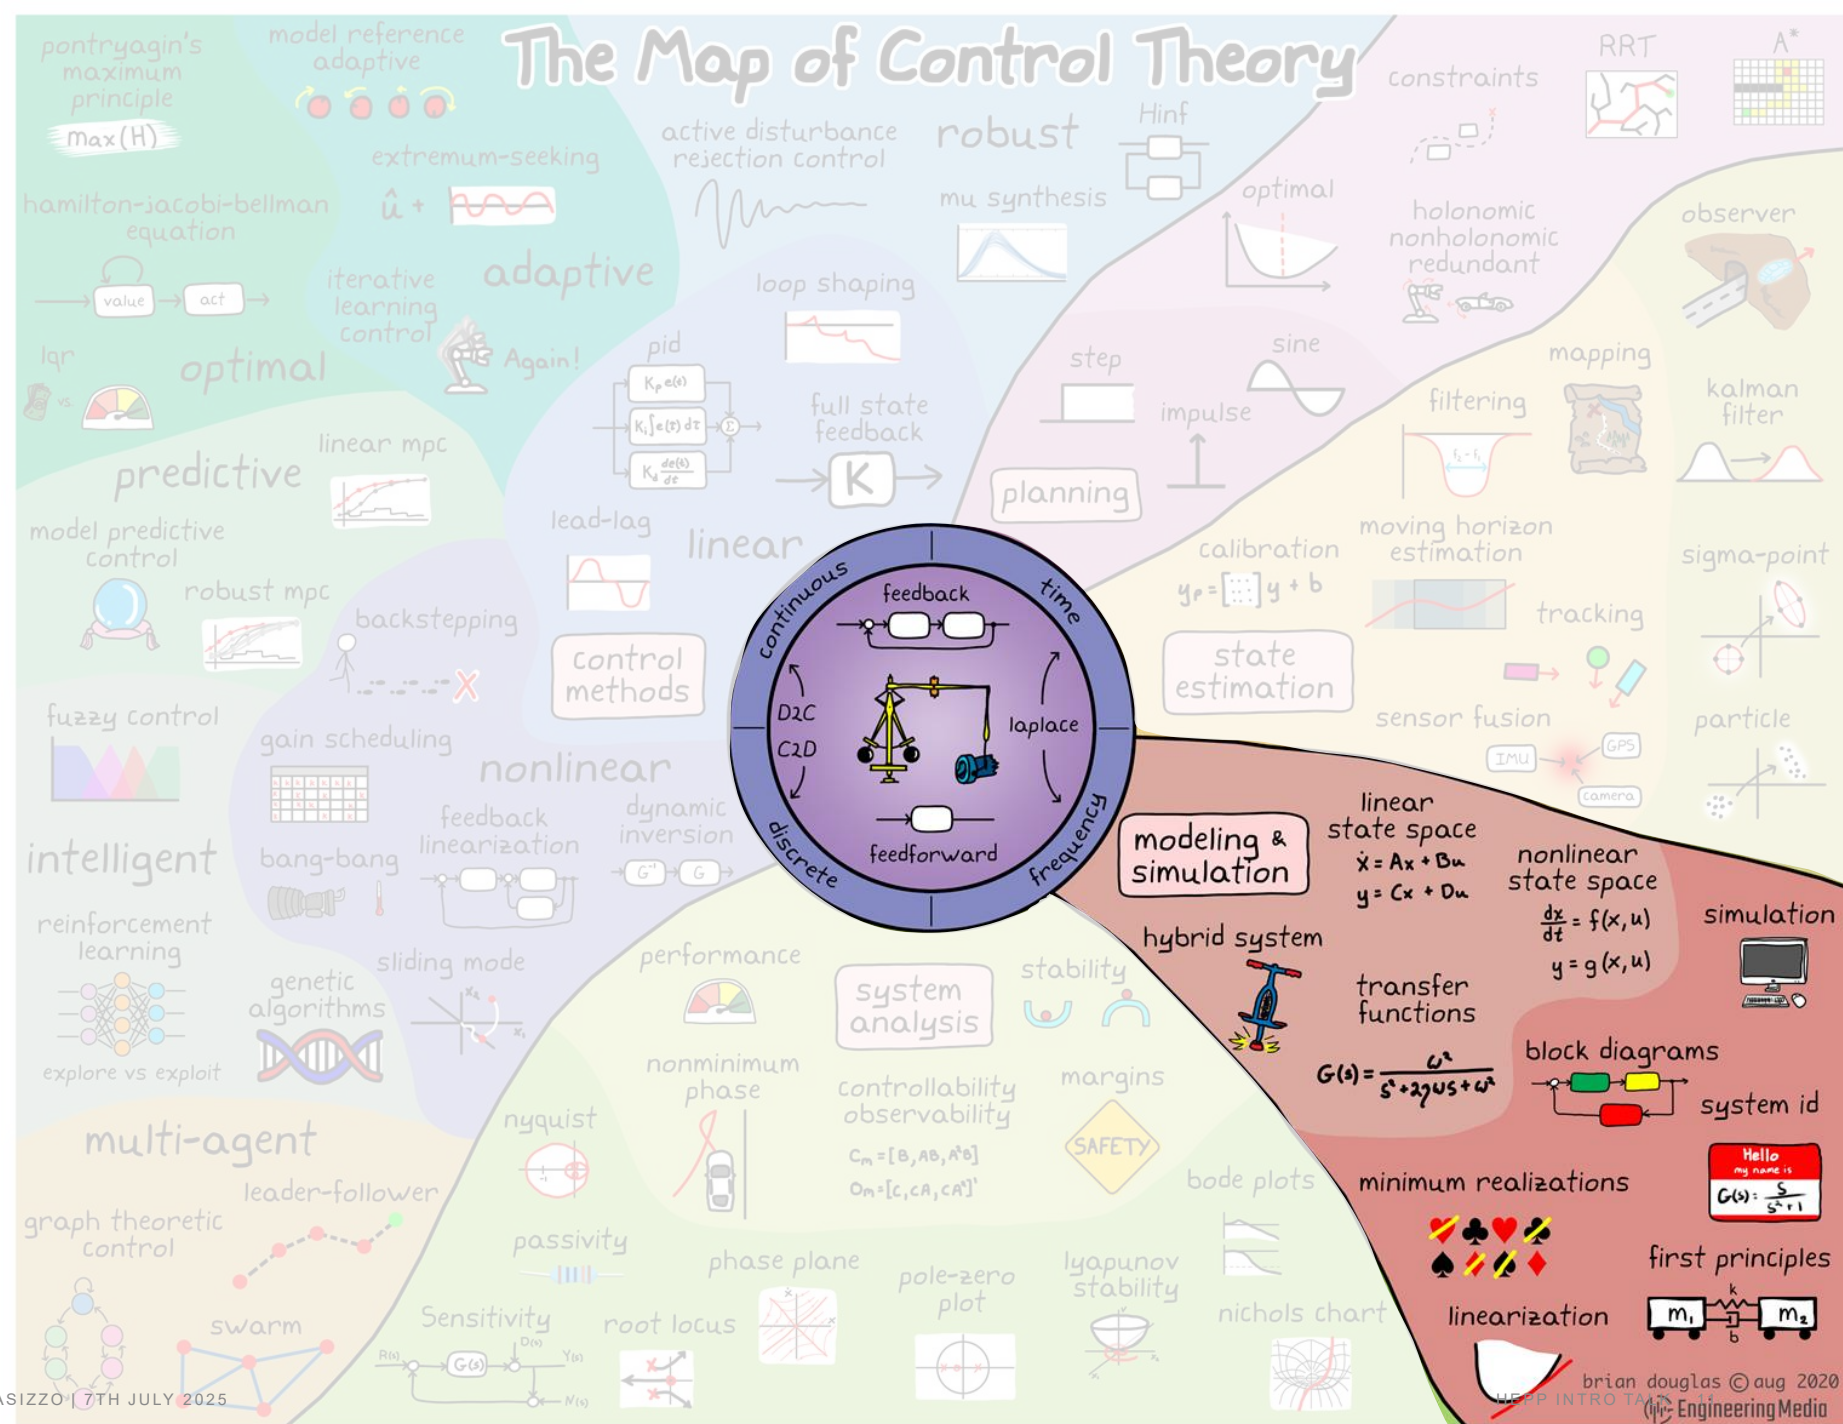

$$F_{feedback} = k_P e + k_I \int e dt + k_D \dot{e}$$

# What is control?

Control the behavior of dynamical systems, even in the presence of uncertainties, disturbances, and changing conditions

Importance of modeling and simulation

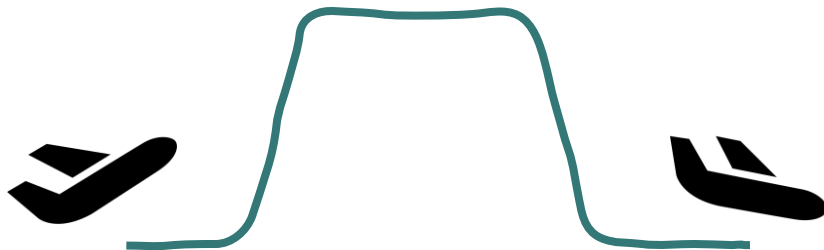

# Outline

- 1) Something about me
- 2) Master thesis project
- 3) Control: what and why?
- 4) AUG flight simulator

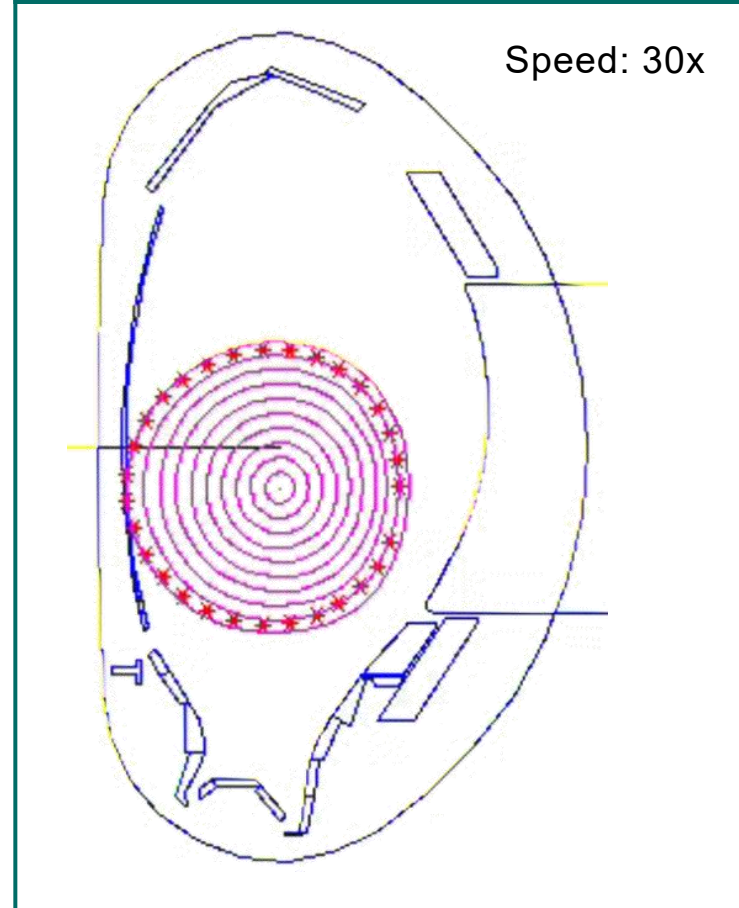

# Flight simulators in fusion

- More than just an integrated model
- Includes the **control system**
- Simulate an **entire shot** from preparation to termination in reasonable time

## From the flight simulator

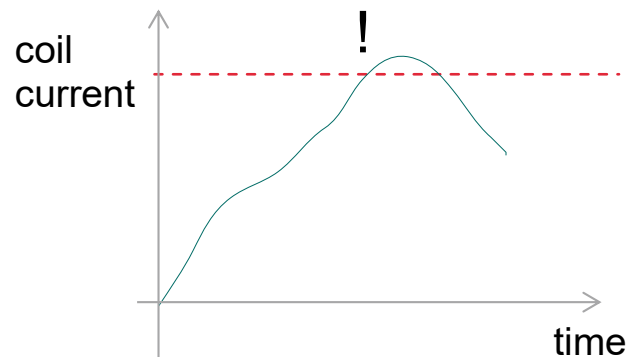

# Why a flight simulator?

1

## Rough validation of a discharge program before the real shot

Check for possible limits violation

2

## Test bench for the development of new controllers

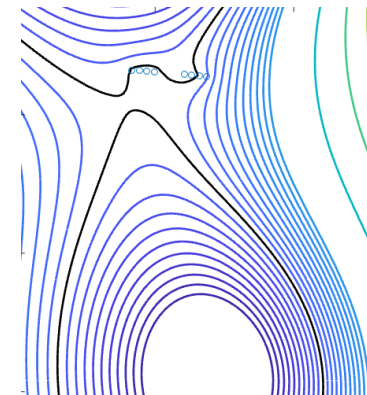

Tune the parameters of a new controller before a real shot

3

## Comparison of plasma models to past experiments

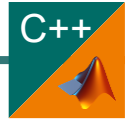

Validate a new plasma model against past AUG experiments

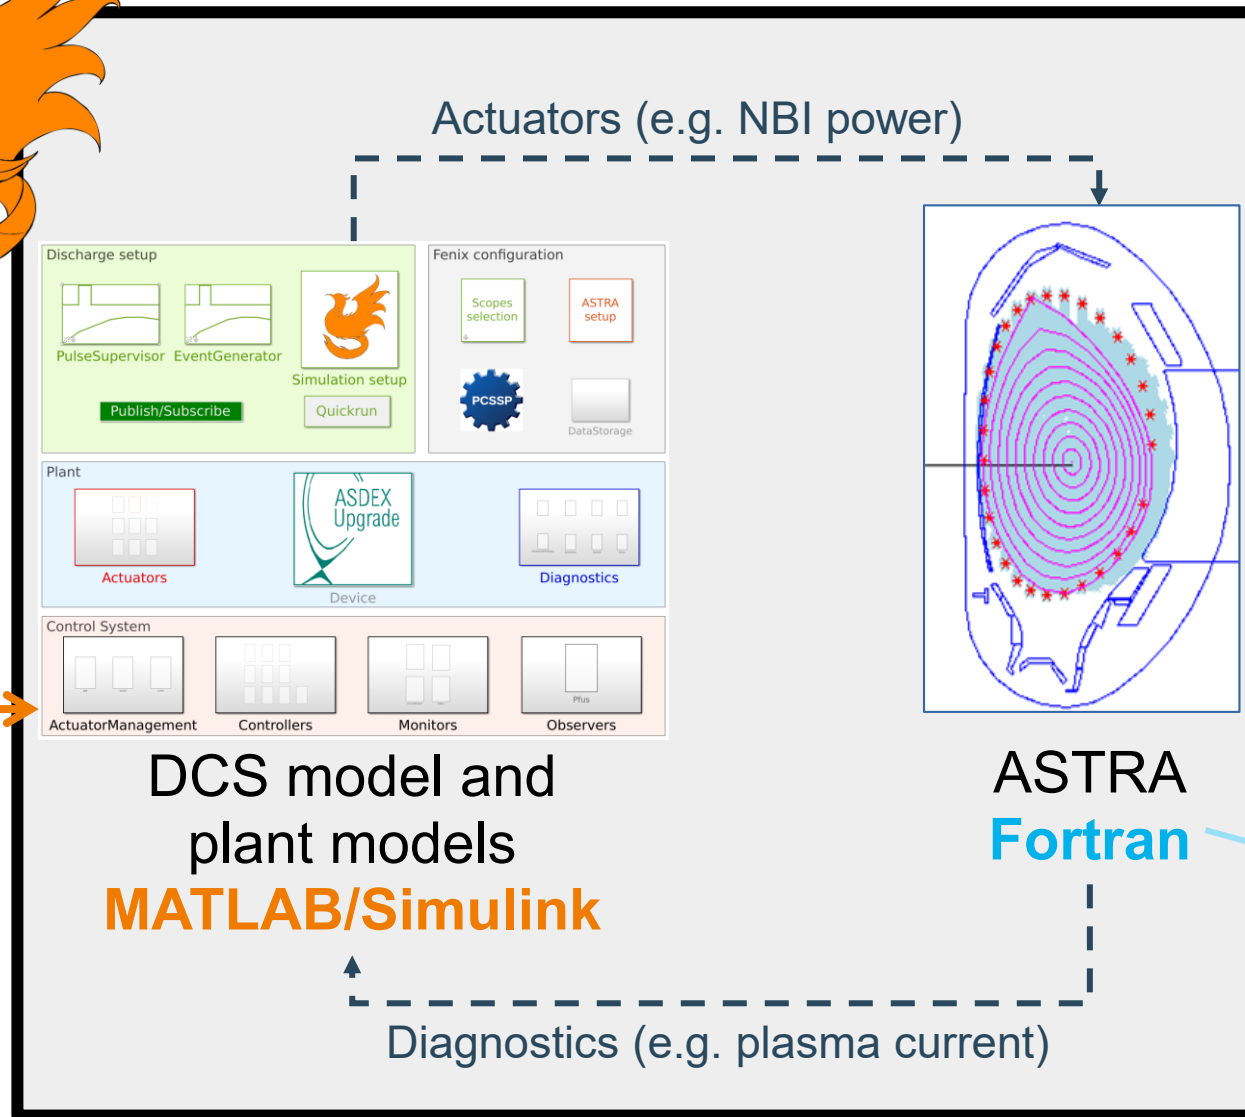

# Fenix is the flight simulator of AUG (and ITER, DEMO, TCV)

Before the simulation:

**DCS** (Discharge  
Control System)  
**C++**

David, Pierre, et al.  
"Update of the integrated  
flight simulator for ASDEX  
Upgrade."  
*Open Plasma Science* 1.3  
(2025).

- Simple plasma and plant models
- Equilibrium solver
- 1D transport code

# Open points for Fenix

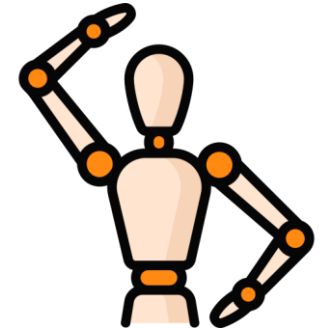

Simulation takes ~10 mins

- **Not possible to run between shots**

Model of the control system

- **Not an ideal copy, may have different behavior**

Possible solution:  
**Run the real control system code**

Code **pre-compilation** and **optimization**

- ~2 mins expected time

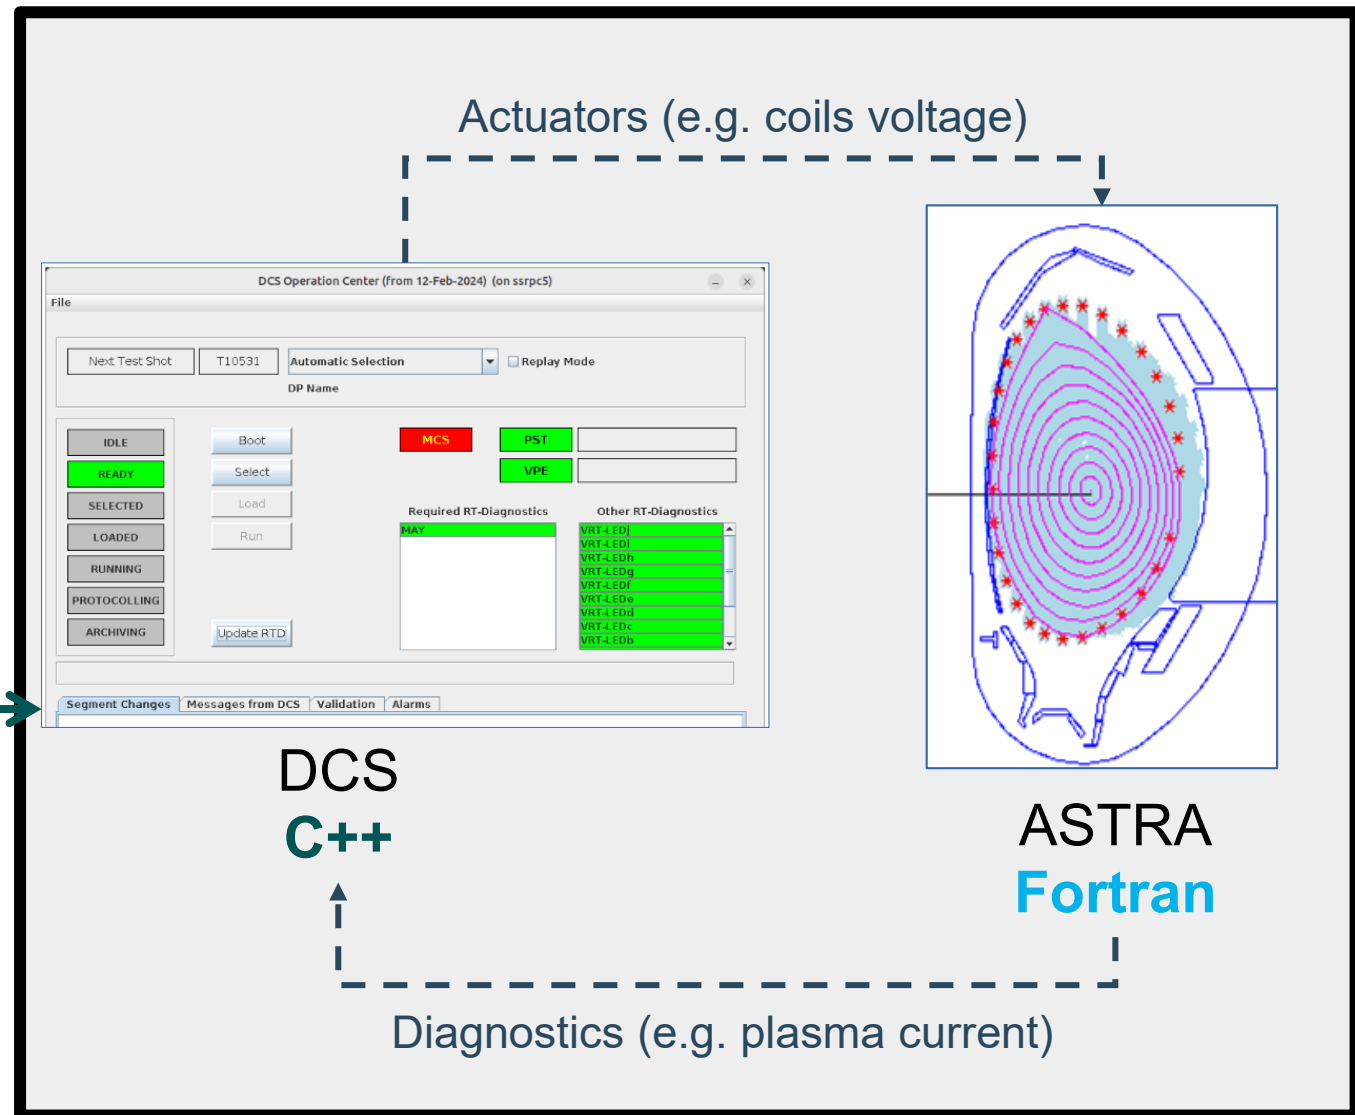

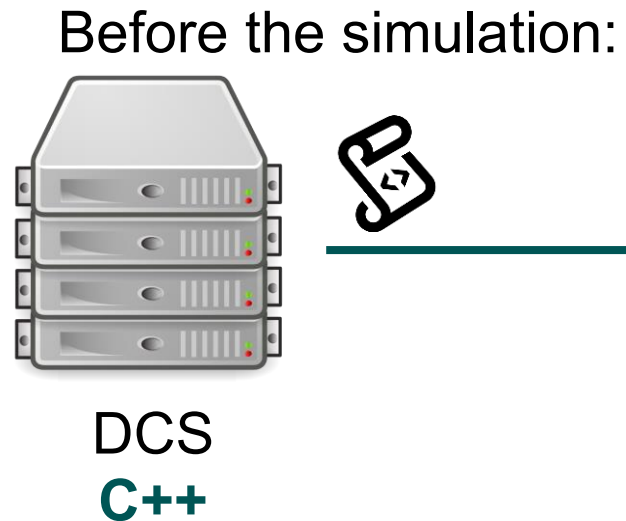

**Software-in-the-loop**

- Copy of the control system

# Development of an alternative flight simulator of AUG:

## “Fenix-DCS”

Looking for a nice name!

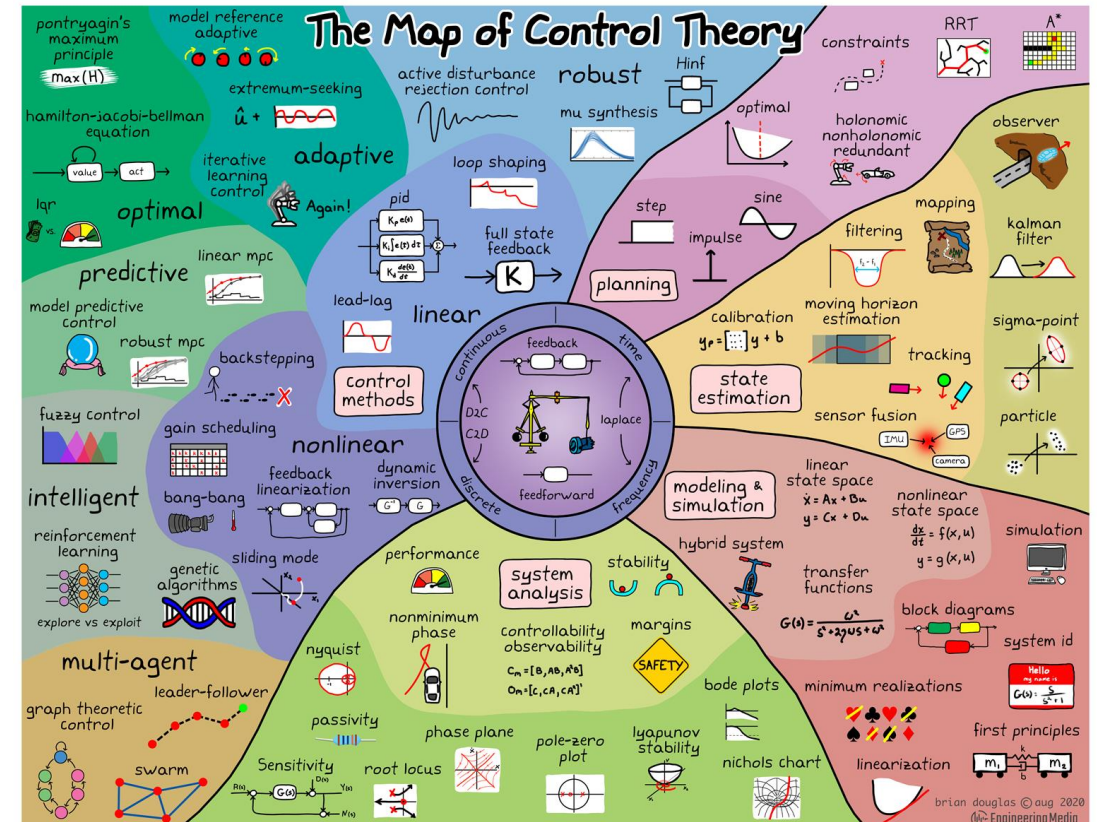

# Future work

- Implement and test the “Fenix-DCS” alternative flight simulator

- Apply “Fenix-DCS” to develop new control algorithms

# Thank you!

I would really appreciate your feedback:
